Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

M PPI; 95-32153642.

The PSDB. R86383.

Inhibiting citrate synthase (CS) activity in plants - to inhibit
flower formation and improve storage capacity, e.g. in potatoes,
also new CS sense and anti-sense DNA sequences.

Claim 6; Page 15-19; 35p; German.

The potato citrate synthase (CS) gene or CDNA sequence encoding CS
(T03410) may be used to produce antisense CS sequences. CS DNA
sequences are useful for altering CS activity in plants. Antisense
CS sequences can be used to inhibit CS expression in plants and has
the effect of inhibiting flower formation and by doing so improves
the plant's storage capacity. This is partic. useful in crop plants
of any kind but esp. useful in potatoes. In addition to altering CS
                                   T03410;

To improve storage of tubers, etc. and to reduce sprouting to improve storage of tubers, etc. and to reduce sprouting claim 5; Page 53-56; 87pp; English.

To identify a cDNA from potato which codes for citrate synthase, a confirmation of the complement of citrate synthase from Arabidopsis thaliana was firstly amplified using A.thaliana cDNA and oligos 104202 and 104203 which are complementary to the 5' or 3' end of the coding region of the arc complementary to the 5' or 3' end of the coding region of introduce BamHI cleavage sites at both ends of the amplified cDNA fragment. a cDNA library was prepd from potato leaves and screened with A. thaliana citrate synthase cDNA. Positive clones were uith A. thaliana citrate synthase cDNA. Positive clones were purified and sequence The nt sequence is given in 104199.

DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting tolaim 7: Page 60-63: 8Tpp. English.

To identify a cDNA from tobacco which codes for citrate synthase, a cDNA bank of leaf tissue from tobacco was prepd. Plaques of this cDNA bank were screened using a radioactive DNA probe which comprises Solanum tuberosum citrate synthase cDNA (104199). One of the clones was sequenced. The nt. sequence is given in 704201.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps 14;
